

Installing "Starter Disable" and "Door Unlock"

The tracking unit has options to disable your starter or unlock your vehicle car doors. Either of these functions can be accessed through the web site or any phone (Interactive Voice Recognition). To check by phone, you will need the serial number on the bottom of the tracking unit. Be sure to write down the serial number before installing the unit.

Starter Disable

Locate vehicle's starter wire. Relay will be required. The **green** wire on the tracking unit must be connected to the relay. See figures 1 and 2 - wiring diagram.

Door Unlock

Requirements:
Power Door Unlocks.

The tracking unit is designed to accommodate negative pulse door unlock triggers. The brown wire is wired to unlock the car doors. If your vehicle is expecting a positive pulse to unlock your car doors you will need to use a relay to convert the negative to a positive. After you have installed the door unlock feature, try unlocking the doors with both the phone and Internet to make sure everything is properly connected.

There are a wide variety of wiring diagrams available on the Internet. You can do a Google search on "wiring diagrams" for the make and model of your vehicle(s).

Track Vehicle - Interactive Voice Recognition (IVR)

After completing installation, you may need to call (888)744-0527 to access the IVR system. Enter the phone number associated with your account and the PIN number. The default is 1234.

2 You will need to know the serial number of the unit. It is located on the bottom of the tracking unit. Once you dial the toll free number you will be prompted for your account phone number and your PIN number.

3 After entering the PIN, you will be able to select the vehicle you would like to locate by entering the serial number. Or, the computer will list all the vehicles in your account. Please note that if you are in a noisy environment, such as the side of a busy road, you can mute your phone and key in information.
